* APC = annual percent change. — = Statistic could not be calculated; for BRFSS estimate of PSA screening, percent was not calculated if there were 20 or fewer respondents; mortality statistics were not calculated if there were 25 or fewer cases.

† Recent prostate specific antigen (PSA) test is defined as a PSA test in preceding year among men 50 years of age or older with no history of prostate cancer; prevalence estimates are based on Centers for Disease Control and Prevention's (CDC) Behavioral Risk Factor Surveillance System (BRFSS) data.

‡ Incidence data are from Surveillance, Epidemiology, and End Results Program and National Program of Cancer Registries areas reported by the North American Association of Central Cancer Registries as meeting high quality standards for 1996-2000.

§ Death data are from CDC's National Vital Statistics System; the data cover the entire U.S. population (<http://www.cdc.gov/nchs>).

|| Rates are per 100,000 and are age-adjusted to the 2000 U.S. standard population by 5-year age groups.

[¶]Values are statistically significantly different from zero; P<.05.

[#]Tertiles are based on the five year prostate cancer mortality rate (see column 5) for white males, 1996-2000.
