

Section XXVII
Childhood Cancer by Site
Incidence, Survival and Mortality

The site groupings used in this section correspond to those used in the rest of the Cancer Statistics Review. While these groupings are not as appropriate for children as they are for adults, they are necessary in order to be able to compare incidence to mortality.

Childhood cancer is better categorized by groupings based on histologic type and site rather than primary site alone (see section XXVIII for Childhood Cancer by the International Classification of Childhood Cancer). For the leukemias and lymphomas, the categories are similar, but for solid tumors the categories can be quite different and the different terminology confusing. For example, in this section 'soft tissue' refers to any type of tumor that arises in connective or soft tissue in contrast to 'soft tissue sarcomas' in the other section, which refers to soft tissue sarcomas in any primary site.

Rates are presented per 100,000 children in this section. In contrast in the other childhood cancer section rates are presented per million children.

Rates are from the SEER Program. They are based on data from population-based registries in Connecticut, New Mexico, Utah, Iowa, Hawaii, Atlanta, Detroit, Seattle-Puget Sound and San Francisco-Oakland. Rates are based on follow-up of patients through 1997.

S The difference in rates between 1974-76 and 1989-96 is statistically significant ($p < .05$).

[†] The standard error of the survival rate is between 5 and 10 percentage points.

^{††} The standard error of the survival rate is greater than 10 percentage points.

Note: The EAPC is the Estimated Annual Percent Change over the time interval.
 Incidence and mortality rates are per 100,000. Survival rates are expressed as percents.
 § SEER Program.
 * NCHS public use tape.
 ★ The EAPC is significantly different from zero (p<.05).
 ♦ The EAPC for 1985-97 is significantly different from the EAPC for 1973-84 (p<.05).
 ◇ The EAPC for 1985-97 is significantly different from the EAPC for 1973-84 (p<.10).
 S The difference in rates between 1974-76 and 1989-96 is statistically significant (p<.05).
 ↑ The standard error of the survival rate is between 5 and 10 percentage points.
 ⊕ The standard error of the survival rate is greater than 10 percentage points.
 ⊕ Sites were chosen based on more than 100 SEER incident cases between 1993-97.
 - Statistic could not be calculated.
