a US 2005 cancer prevalence counts are based on 2005 cancer prevalence proportions from the SEER 9 registries and 1/1/2005 US population estimates based on the average of 2004 and 2005 population estimates from the US Bureau of the Census.
bcde
(b) Prevalence estimates are ambiguous for those with multiple cancers, unless the tumor inclusion criteria are understood. Depending on the application, different inclusion criteria may be appropriate. This table provides three different methods of tumor inclusion: (c) First invasive tumor ever; (d) First invasive tumor for each cancer site diagnosed during the previous 30 years (1975-2004); (e) First invasive tumor for each cancer site diagnosed during the previous 5 years (2000-2004).
For definitions (d) and (e) all sites is treated as a separate cancer "site".
Consider a woman who had three invasive cancers: Melanoma in 1981; Breast cancer in 2000; Melanoma in 2001.

In method (c) the melanoma is the woman's first cancer, and is counted for the melanoma and all sites 30 -year limited duration prevalence. For 5-year limited duration prevalence, the woman is not counted at all since her first cancer occurred more than 5 years prior to 1/1/2005.
In method (d) the 1981 melanoma is counted for the melanoma and all sites 30 -year limited duration prevalence. The 2000 breast cancer is counted for the breast 5-year and 30 -year limited duration prevalence.
In method (e) the 2000 breast cancer is counted for the breast cancer and all sites 5-year limited duration prevalence. The 2001 melanoma is counted for 5-year limited duration prevalence for melanoma.
f Ovary excludes borderline cases or histologies 8442, 8451, 8462, 8472, and 8473.

US 2005 cancer prevalence counts are based on 2005 cancer prevalence proportions from the SEER 9 registries (San Francisco, Connecticut, Detroit, Hawaii, Iowa, New Mexico, Seattle, Utah, and Atlanta) and 1/1/2005 US population estimates based on the average of 2004 and 2005 population estimates from the US Bureau of the Census. Prevalence was calculated using the First Malignant Primary Only for a person.
Cases diagnosed more than 30 years ago were estimated using the completeness index method (Capocaccia et. al. 1997, Merrill et. al. 2000).
Due to rounding, the sum of the age specific estimates may not equal the all ages estimate.

a US 2005 cancer prevalence counts are based on 2005 cancer prevalence proportions from the SEER 9 registries (San Francisco, Connecticut, Detroit, Hawaii, Iowa, New Mexico, Seattle, Utah, and Atlanta) and $1 / 1 / 2005$ US population estimates based on the average of 2004 and 2005 population estimates from the US Bureau of the Census. Prevalence was calculated using the First Malignant Primary Only for a person.
Cases diagnosed more than 30 years ago were estimated using the completeness index method (Capocaccia et. al. 1997 , Merrill et.
b Cases diag
c Due to rounding, the sum of the age specific estimates may not equal the all ages estimate.
Ovary excludes borderline cases or histologies 8442 , $8451,8462,8472$, and 8473 .

a US 2005 cancer prevalence counts are based on 2005 cancer prevalence proportions from the SEER registries and $1 / 1 / 2005$ US bcd calculated using the First Malignant Primary Only for a person.

Maximum limited-duration prevalence: 30 years for $1975-2005$ SEER 9 data; 15 years for $1990-2005$ SEER 11 data (used to calculate prevalence for Hispanics and Asian Pacific Islanders).
f hi Percentages are age-adjusted to the 2000 US Standard Population (19 age groups - Census P25-1130) by 5-year age groups.
(g) Cases diagnosed more than 30 years ago were estimated using the completeness index method (Capocaccia et. al. 1997 , Merrill et. al. 2000). (h) Complete prevalence is obtained by summing 0 to <30 and >=30. (i)Age-specific completeness index was

- Statistic not shown. Statistic based on fewer than 5 cases estimated alive in SEER for the time interval.
