Question 20190082

References:

2018 EOD Manual. v1.7

Question:

Primary site/Histology--Peritoneum: What is the correct primary site code for peritoneal mesothelioma in a female? When I use C482, it seems that the fields are all geared towards primary peritoneal carcinoma with FIGO staging, etc.

Discussion:

Answer:

For mesothelioma, NOS (9050) and epithelioid mesothelioma (9052) of the peritoneum for females, assign C481, C482, or C488 as appropriate based on the site of origin in the medical documentation. The Primary Peritoneal Ca schema is assigned and you will need to complete the SSDIs for FIGO staging, CA-125 PreTx Interpretation, and Residual Tumor Volume Post Cytoreduction.

If the histology is 9051 or 9053 with primary site of C481, C482, or C488 for females, the Retroperitoneum schema is assigned. The only SSDI for this schema is Bone Invasion.

Cancer Site Category:

N/A

Data Item Category:

Primary site, Histology
