Question:

Reportability/Histology--Anus: Are 2021 diagnoses of anal intraepithelial neoplasia (AIN) II or AIN II-III reportable in patients with a known history of AIN II or AIN II-III diagnosed prior to 2021? See Discussion.

Discussion:

Patient has a history of AIN I/low-grade squamous intraepithelial lesion (LSIL) dating back to at least 2015, was diagnosed with AIN II-III in 12/2019, and then diagnosed again with AIN II-III in 08/2021. There is no indication of treatment or a disease-free interval for this patient.

SINQ 20210015, while not an exact match to this case, implies there is no clear disease-free interval for these AIN diagnoses, so it is the same non-reportable neoplasm diagnosed prior to reportability (12/2019). However, there was a diagnosis of a reportable neoplasm in 2021, so it also seems possible this would be accessioned as a reportable tumor based on a diagnosis of reportable tumor diagnosis in 2021.

With the reportability changes for these intraepithelial neoplasia II/II-III tumors, these situations will arise more frequently.

Answer:

Report AIN II and AIN II-III cases when initially diagnosed in 2021 or later. Do not report retrospective cases; that is, cases with diagnoses prior to 2021 with continuation of AIN II or AIN II-III extending into the reportable period.
