HEAD AND NECK

DEFINITION OF ANATOMIC SITES WITHIN THE HEAD AND NECK

Note: Not all sites in the lip, oral cavity, pharynx and salivary glands are listed below. All sites to which a Summary Stage chapter applies are listed at the beginning of the chapter.

LIP, ORAL CAVITY and PHARYNX
The oral cavity extends from the skin-vermilion junction of the lips to the junction of the hard and soft palate above and to the line of circumvallate papillae below.

It includes the vault, floor (superior surface of soft palate), posterior wall, lateral walls including the fossae of Rosenmuller and the mucosa covering the torus tubarius forming the eustachian tube orifice. According to the AJCC, the posterior margins of the choanal orifices and of the nasal septum are included in the nasal fossa (which has no AJCC chapter), and are excluded from the nasopharynx staging system. However, all subsites listed above (except nasal fossa) are included in the nasopharynx Summary Stage chapter. Specific anatomic descriptions of major nasopharyngeal subsites include:

REGIONAL LYMPH NODES FOR HEAD AND NECK PRIMARIES

With the release of AJCC 7th edition in 2010, Level I-Level VII and “other” regional nodes in the head and neck region were made regional for all head and neck subsites. This change was not incorporated into Summary Stage 2000. For Summary Stage 2018, the head and neck nodes listed below, which are regional for AJCC 8th edition, will be made regional. This change is effective for cases diagnosed for 1/1/2018 and forward only.

The lymph nodes below are regional for all Head and Neck sites (C00-C14, C30-C33) and include: Single, Multiple, Bilateral and Contralateral lymph nodes.

1. Historically, carcinomas described as “confined to mucosa” have been assigned 1 (localized). In order to provide greater specificity and to rule out the possibility of classifying noninvasive tumors in this category, abstractors should determine if
   a. The tumor is confined to the epithelium, in which case it is in situ OR
   b. The tumor has penetrated the basement membrane to invade the lamina propria, in which case Summary Stage is assigned 1 (localized).

2. The layers the oral cavity consist of
   a. The EPITHELIAL LAYER which borders on the lumen and contains no blood vessels or lymphatics
   b. The BASEMENT MEMBRANE, a sheet of extracellular material, functions as a filtration barrier and a boundary involved in generating and maintaining tissue structure
   c. The LAMINA PROPIA, composed of areolar connective tissue, contains blood vessels, nerves, and, in some regions, glands. Once tumor has broken through the basement membrane into the lamina propria, it can spread by way of the lymphatics and blood vessels to other parts of the body

3. The lip, oral cavity and pharynx lack a MUSCULARIS MUCOSAE. Therefore, the lamina propria and the submucosa tend to merge, and the two terms are used interchangeably.

4. The SUBMUCOSA is a thick layer of either dense or areolar connective tissue. It contains blood vessels, lymphatic vessels, nerves, and, in some regions, glands. Only the GUM and HARD PALATE lack a submucosa, but rather a mucoperiosteum.
5. The **MUSCULARIS PROPRIA** is muscle tissue which constitutes the wall of the organ. The GUM and HARD PALATE lack a muscularis.

6. There is no **SEROSA** on any of the head and neck sites.

Note 3: The intrinsic muscles of tongue are four paired muscles within the tongue which control its shape. The extrinsic muscles originate from structures outside the tongue and control its positioning.

Note 4: Parapharyngeal involvement (pharyngeal space invasion) (code 7) denotes posterolateral infiltration of tumor beyond the pharyngobasilar fascia. The pharyngobasilar fascia is the fibrous layer of the pharyngeal wall between the mucosa and the muscular layer, attached superiorly to the basilar part of the occipital bone and diminishing in thickness as it descends.

Note 5: The masticator space (code 7) primarily consists of the muscles of mastication, the medial and lateral pterygoid, masseter, and temporalis muscles. The space also includes the ramus of the mandible and the third division of cranial nerve V as it passes through the foramen ovale into the suprahyoid neck.

Note 3: The bones of the lateral wall of the nasal cavity include the maxilla, the perpendicular plate of the palatine bone, the medial pterygoid plate, the labyrinth and inferior concha of the ethmoid. The roof of the nasal cavity is formed by the nasal bone. The floor of the nasal cavity, which forms the roof of the mouth, is composed of the bones of the hard palate: the horizontal plate of the palatine bone posteriorly and the palatine process of the maxilla anteriorly.

Note 4: Involvement of or extension to bone includes any type of tumor extension to the bone, such as erosion, invasion, extension, penetration, or destruction.

Note 5: "Bony invasion" does not include extension to palate, cribiform plate, or pterygoid plates. Extension to these structures is coded separately.

Note 6: “Bony invasion” does include involvement of perpendicular plate of ethmoid bone or ethmoid air cells.

Note 7: Code 2 for base of skull, NOS when there is no information available for more specific bony structures in the skull.
Note 8: Minimal extension to anterior cranial fossa implies tumor pushing through the cribriform plate, but without invasion of the dura or brain.

MELANOMA HEAD AND NECK (8720-8790)

8720-8790 (C003-C005, C008-C069, C090-C148, C300-C329)

Note 1: The following sources were used in the development of this chapter

- Collaborative Stage Data Collection System, version 02.05: https://cancerstaging.org/cstage/Pages/default.aspx

Note 2: Mucosal melanomas occur throughout the mucosa of the lip and oral cavity (C003-C005, C008-C069, C090-C148) and the nasal cavity and middle ear (C300-C301), accessory sinuses (C310-C319) and the larynx (C320-C329). For a more detailed description of anatomy, refer to the appropriate Summary Stage 2018 chapter based on the location of the mucosal melanoma.

Note 3: Code 1 for localized tumors when no other information is available or for extension involving the mucosa only of adjacent sites.

Note 4: Extension involving the deeper tissues of the primary or adjacent sites are either regional or distant, depending on the involvement.

- Code 2 for regional when the only information available is “deep tissue involvement.”

Note 5: The description of lymph nodes has been standardized across the head and neck chapters. Levels I-VII and the “other” lymph nodes are regional (code 3).
